Our radiators are tested in qualified laboratories according to EN-442 regulations which determine the output value by fixing the  $\Delta T$  at 50 °C.  $\Delta T$  is the difference between the average temperature of the water inside the radiator and the room temperature. The formula is:  $\phi_x = \phi_{\Delta T_{50}} * (\Delta T_x / 50)^n$ .

Ex.:  $((75+65)/2)-20 = 50 \text{ }^\circ\text{C}$ . For output values with a different  $\Delta T$  use the following formula:  $\phi_x = \phi_{\Delta T_{50}} * (\Delta T_x / 50)^n$ .

See calculation example of the output at  $\Delta T 60 \text{ }^\circ\text{C}$  of article 388411:  $368 * (60/50)^{1,20560} = 459$ .

Output values in kcal/h = watt x 0,85984. Output values in btu = watt x 3,412.

#### KEY

$T_1$  = supply temperature -  $T_2$  = return temperature -  $T_3$  = room temperature.

$\phi_x$  = output to be calculated -  $\phi_{\Delta T_{50}}$  = output at  $\Delta T 50 \text{ }^\circ\text{C}$  (table) -  $\Delta T_x$  =  $\Delta T$  value to be calculated -  $n$  = exponent "n" (table).
